Image Augmentation for Deep Learning With Keras

by **Jason Brownlee** on June 29, 2016 in **Deep Learning**

🐦   f   in   G+

Data preparation is required when working with neural network and deep learning models. Increasingly data augmentation is also required on more complex object recognition tasks.

In this post you will discover how to use data preparation and data augmentation with your image datasets when developing and evaluating deep learning models in Python with Keras.

After reading this post, you will know:

- About the image augmentation API provide by Keras and how to use it with your models.
- How to perform feature standardization.
- How to perform ZCA whitening of your images.
- How to augment data with random rotations, shifts and flips.
- How to save augmented image data to disk.

Let's get started.

- **Update**: The examples in this post were updated for the latest Keras API. The datagen.next() function was removed.
- **Update Oct/2016**: Updated examples for Keras 1.1.0, TensorFlow 0.10.0 and scikit-learn v0.18.
- **Update Jan/2017**: Updated examples for Keras 1.2.0 and TensorFlow 0.12.1.
- **Update Mar/2017**: Updated example for Keras 2.0.2, TensorFlow 1.0.1 and Theano 0.9.0.

Keras Image Augmentation API

Like the rest of Keras, the image augmentation API is simple and powerful.

Keras provides the ImageDataGenerator class that defines the configuration for image data preparation and augmentation. This includes capabilities such as:

- Sample-wise standardization.
- Feature-wise standardization.
- ZCA whitening.
- Random rotation, shifts, shear and flips.
- Dimension reordering.
- Save augmented images to disk.

An augmented image generator can be created as follows:

```
1  datagen = ImageDataGenerator()
```

Rather than performing the operations on your ent[   ] to be iterated by the deep learning model fitting proc[   ]in-time. This reduces your memory overhead, but add[   ]g.

After you have created and configured your **Image** will calculate any statistics required to actually per this by calling the **fit()** function on the data genera

```
1  datagen.fit(train)
```

The data generator itself is in fact an iterator, retur[   ]*We can configure the batch size and prepare the data[   ]e* **flow()** function.

```
1  X_batch, y_batch = datagen.flow(train, train, batch_size=32)
```

Finally we can make use of the data generator. Instead of calling the **fit()** function on our model, we must call the **fit_generator()** function and pass in the data generator and the desired length of an epoch as well as the total number of epochs on which to train.

```
1  fit_generator(datagen, samples_per_epoch=len(train), epochs=100)
```

You can learn more about the Keras image data generator API in the Keras documentation.

Point of Comparison for Image Augmentation

Now that you know how the image augmentation API in Keras works, let's look at some examples.

We will use the MNIST handwritten digit recognition task in these examples. To begin with, let's take a look at the first 9 images in the training dataset.

```
1   # Plot images
2   from keras.datasets import mnist
3   from matplotlib import pyplot
4   # load data
5   (X_train, y_train), (X_test, y_test) = mnist.load_data()
6   # create a grid of 3x3 images
7   for i in range(0, 9):
8       pyplot.subplot(330 + 1 + i)
9       pyplot.imshow(X_train[i], cmap=pyplot.get_cmap('gray'))
10  # show the plot
11  pyplot.show()
```

Running this example provides the following image   he
image preparation and augmentation in the examp

Example MNIST images

Feature Standardization

It is also possible to standardize pixel values across the entire dataset. This is called feature standardization and mirrors the type of standardization often performed for each column in a tabular dataset.

You can perform feature standardization by setting the featurewise_center and featurewise_std_normalization arguments on the ImageDataGenerator class. These are in fact set to True by default and creating an instance of ImageDataGenerator with no arguments will have the same effect.

```
1  # Standardize images across the dataset, mean=0, stdev=1
2  from keras.datasets import mnist
3  from keras.preprocessing.image import ImageDataGenerator
4  from matplotlib import pyplot
5  from keras import backend as K
6  K.set_image_dim_ordering('th')
7  # load data
8  (X_train, y_train), (X_test, y_test) = mnist.load_data()
9  # reshape to be [samples][pixels][width][height]
10 X_train = X_train.reshape(X_train.shape[0], 1, 28, 28)
11 X_test = X_test.reshape(X_test.shape[0], 1
12 # convert from int to float
13 X_train = X_train.astype('float32')
14 X_test = X_test.astype('float32')
15 # define data preparation
16 datagen = ImageDataGenerator(featurewise_ce
17 # fit parameters from data
18 datagen.fit(X_train)
19 # configure batch size and retrieve one bat
20 for X_batch, y_batch in datagen.flow(X_tra
21     # create a grid of 3x3 images
22     for i in range(0, 9):
23         pyplot.subplot(330 + 1 + i)
24         pyplot.imshow(X_batch[i].reshape(28
25     # show the plot
26     pyplot.show()
27     break
```
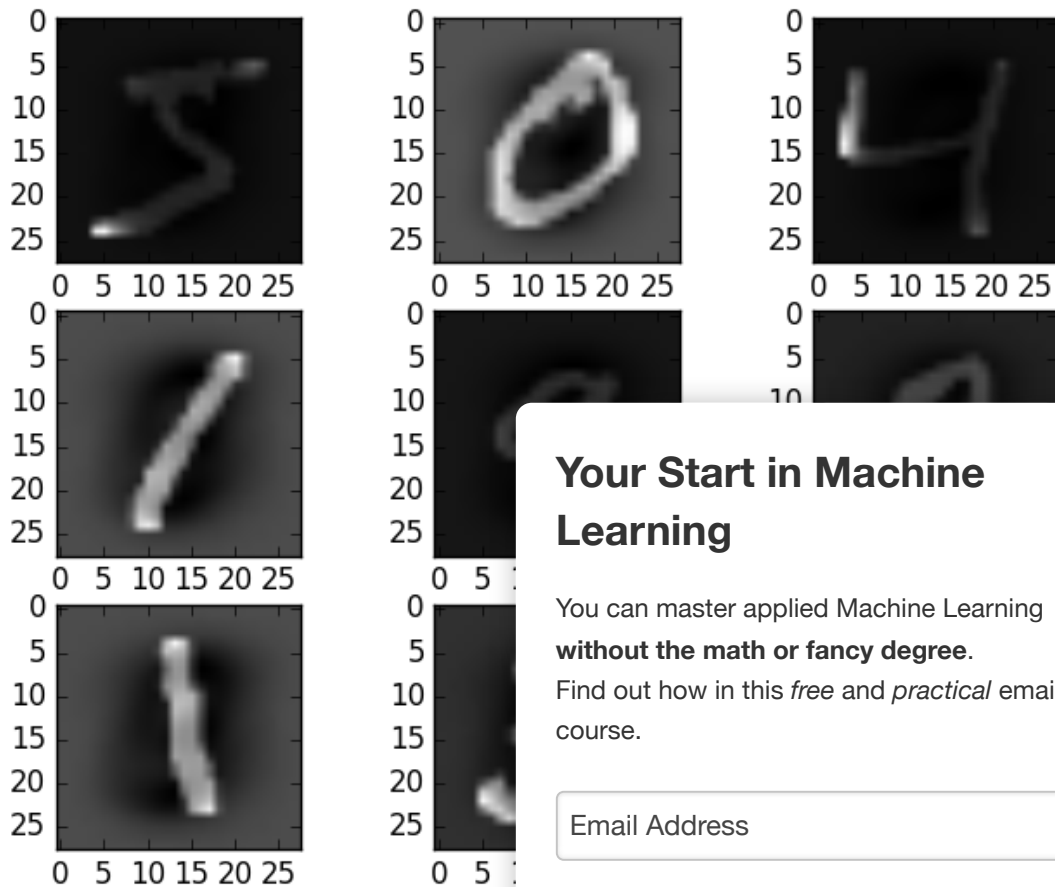

Running this example you can see that the effect is different digits.

Standardized Fe

ZCA Whitening

A whitening transform of an image is a linear algebra operation that reduces the redundancy in the matrix of pixel images.

Less redundancy in the image is intended to better highlight the structures and features in the image to the learning algorithm.

Typically, image whitening is performed using the Principal Component Analysis (PCA) technique. More recently, an alternative called ZCA (learn more in A

and results in transformed images that keeps all of

transformed images still look like their originals.

You can perform a ZCA whitening transform by setting the zca_whitening argument to True.

```
1  # ZCA whitening
2  from keras.datasets import mnist
3  from keras.preprocessing.image import ImageDataGenerator
4  from matplotlib import pyplot
5  from keras import backend as K
6  K.set_image_dim_ordering('th')
7  # load data
8  (X_train, y_train), (X_test, y_test) = mnist.load_data()
9  # reshape to be [samples][pixels][width][height]
10 X_train = X_train.reshape(X_train.shape[0], 1, 28, 28)
```

```
11 X_test = X_test.reshape(X_test.shape[0], 1, 28, 28)
12 # convert from int to float
13 X_train = X_train.astype('float32')
14 X_test = X_test.astype('float32')
15 # define data preparation
16 datagen = ImageDataGenerator(zca_whitening=True)
17 # fit parameters from data
18 datagen.fit(X_train)
19 # configure batch size and retrieve one batch of images
20 for X_batch, y_batch in datagen.flow(X_train, y_train, batch_size=9):
21     # create a grid of 3x3 images
22     for i in range(0, 9):
23         pyplot.subplot(330 + 1 + i)
24         pyplot.imshow(X_batch[i].reshape(28, 28), cmap=pyplot.get_cmap('gray'))
25     # show the plot
26     pyplot.show()
27     break
```

Running the example, you can see the same gener each digit has been highlighted.
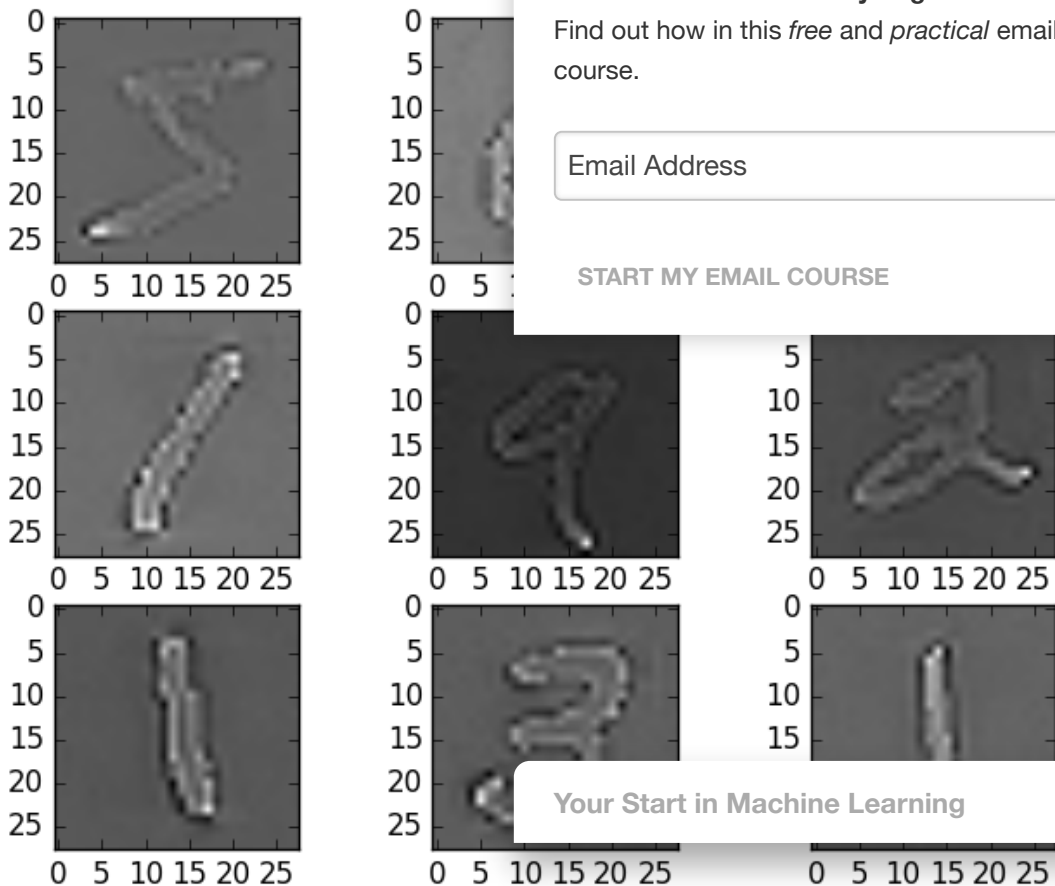

ZCA Whitening MNIST Images

Random Rotations

Sometimes images in your sample data may have varying and different rotations in the scene.

You can train your model to better handle rotations of images by artificially and randomly rotating images from your dataset during training.

The example below creates random rotations of the MNIST digits up to 90 degrees by setting the rotation_range argument.

```
1   # Random Rotations
2   from keras.datasets import mnist
3   from keras.preprocessing.image import ImageDataGenerator
4   from matplotlib import pyplot
5   from keras import backend as K
6   K.set_image_dim_ordering('th')
7   # load data
8   (X_train, y_train), (X_test, y_test) = mnist.load_data()
9   # reshape to be [samples][pixels][width][height]
10  X_train = X_train.reshape(X_train.shape[0], 1, 28, 28)
11  X_test = X_test.reshape(X_test.shape[0], 1, 28, 28)
12  # convert from int to float
13  X_train = X_train.astype('float32')
14  X_test = X_test.astype('float32')
15  # define data preparation
16  datagen = ImageDataGenerator(rotation_range
17  # fit parameters from data
18  datagen.fit(X_train)
19  # configure batch size and retrieve one bat
20  for X_batch, y_batch in datagen.flow(X_tra
21      # create a grid of 3x3 images
22      for i in range(0, 9):
23          pyplot.subplot(330 + 1 + i)
24          pyplot.imshow(X_batch[i].reshape(28
25      # show the plot
26      pyplot.show()
27      break
```
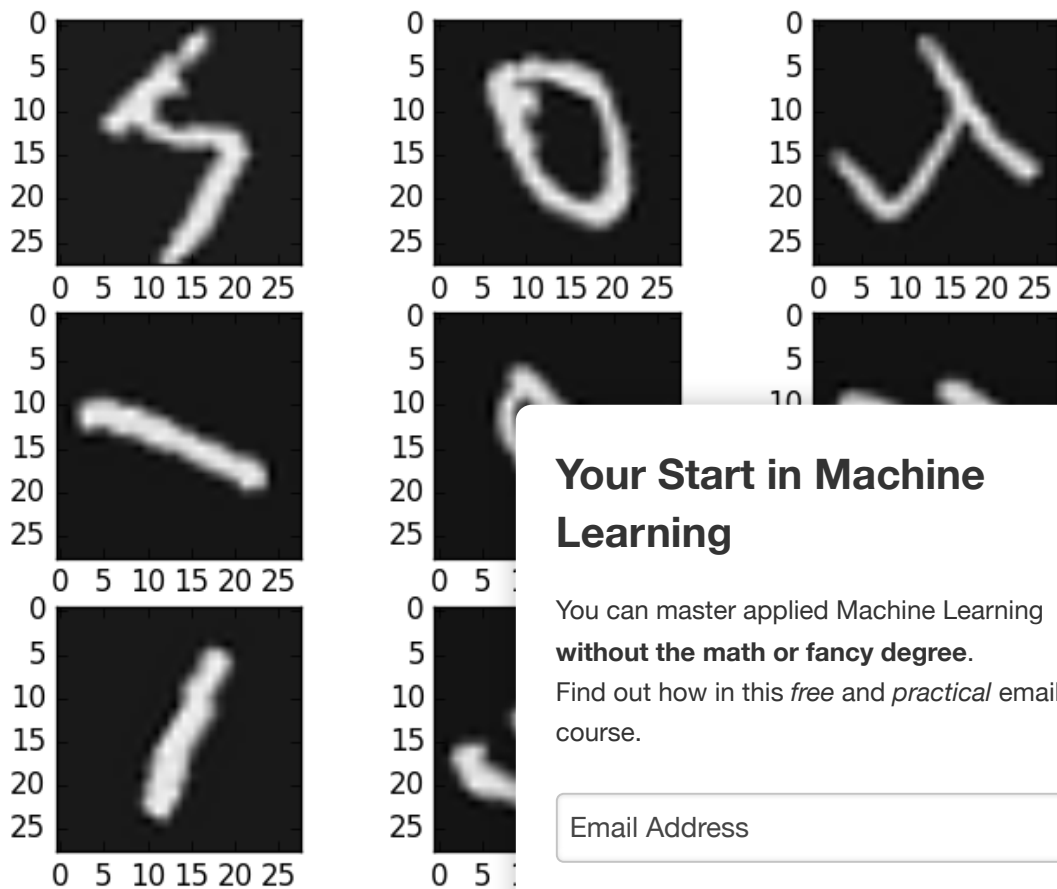

Running the example, you can see that images ha
degrees. This is not helpful on this problem becaus
but this transform might be of help when learning
different orientations.

Your Start in Machine Learning

Random Rotatio

Random Shifts

Objects in your images may not be centered in the frame. They may be off-center in a variety of different ways.

You can train your deep learning network to expect and currently handle off-center objects by artificially creating shifted versions of your training data. Keras supports separate horizontal and vertical random shifting of training data by the width_shift_range and height_shift_range arguments.

```
1  # Random Shifts
2  from keras.datasets import mnist
3  from keras.preprocessing.image import ImageDataGenerator
4  from matplotlib import pyplot
5  from keras import backend as K
6  K.set_image_dim_ordering('th')
7  # load data
8  (X_train, y_train), (X_test, y_test) = mnist.load_data()
9  # reshape to be [samples][pixels][width][height]
10 X_train = X_train.reshape(X_train.shape[0], 1, 28, 28)
11 X_test = X_test.reshape(X_test.shape[0], 1, 28, 28)
12 # convert from int to float
13 X_train = X_train.astype('float32')
14 X_test = X_test.astype('float32')
15 # define data preparation
16 shift = 0.2
17 datagen = ImageDataGenerator(width_shift_range=shift, height_shift_range=shift)
18 # fit parameters from data
19 datagen.fit(X_train)
```
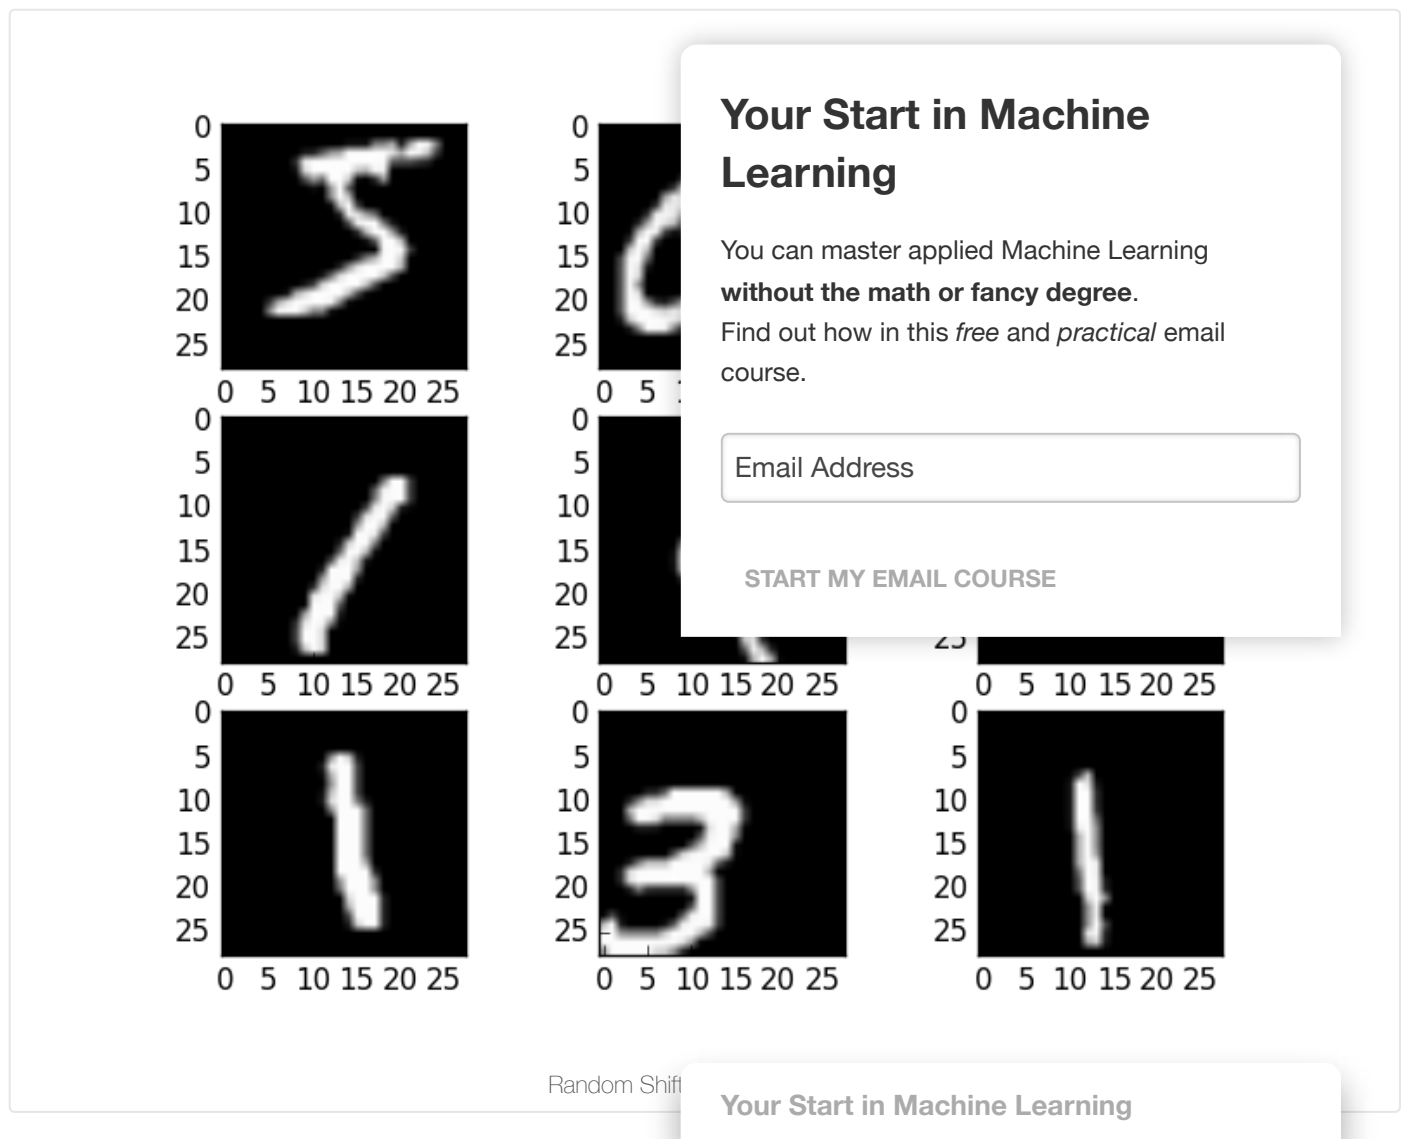

```
20  # configure batch size and retrieve one batch of images
21  for X_batch, y_batch in datagen.flow(X_train, y_train, batch_size=9):
22      # create a grid of 3x3 images
23      for i in range(0, 9):
24          pyplot.subplot(330 + 1 + i)
25          pyplot.imshow(X_batch[i].reshape(28, 28), cmap=pyplot.get_cmap('gray'))
26      # show the plot
27      pyplot.show()
28      break
```

Running this example creates shifted versions of the digits. Again, this is not required for MNIST as the handwritten digits are already centered, but you can see how this might be useful on more complex problem domains.

Random Shift

Your Start in Machine Learning

Random Flips

Another augmentation to your image data that can improve performance on large and complex problems is to create random flips of images in your training data.

Keras supports random flipping along both the vertical and horizontal axes using the vertical_flip and horizontal_flip arguments.

```
1  # Random Flips
2  from keras.datasets import mnist
3  from keras.preprocessing.image import ImageDataGenerator
4  from matplotlib import pyplot
5  from keras import backend as K
```

```
 6  K.set_image_dim_ordering('th')
 7  # load data
 8  (X_train, y_train), (X_test, y_test) = mnist.load_data()
 9  # reshape to be [samples][pixels][width][height]
10  X_train = X_train.reshape(X_train.shape[0], 1, 28, 28)
11  X_test = X_test.reshape(X_test.shape[0], 1, 28, 28)
12  # convert from int to float
13  X_train = X_train.astype('float32')
14  X_test = X_test.astype('float32')
15  # define data preparation
16  datagen = ImageDataGenerator(horizontal_flip=True, vertical_flip=True)
17  # fit parameters from data
18  datagen.fit(X_train)
19  # configure batch size and retrieve one batch of images
20  for X_batch, y_batch in datagen.flow(X_train, y_train, batch_size=9):
21      # create a grid of 3x3 images
22      for i in range(0, 9):
23          pyplot.subplot(330 + 1 + i)
24          pyplot.imshow(X_batch[i].reshape(28
25      # show the plot
26      pyplot.show()
27      break
```

Running this example you can see flipped digits. F   e
the correct left and right orientation, but this may b   s in
a scene that can have a varied orientation.

Randomly Flipped MNIST Images

Saving Augmented Images to File

The data preparation and augmentation is performed just in time by Keras.

This is efficient in terms of memory, but you may require the exact images used during training. For example, perhaps you would like to use them with a different software package later or only generate them once and use them on multiple different deep learning models or configurations.

Keras allows you to save the images generated during training. The directory, filename prefix and image file type can be specified to the flow() function before training. Then, during training, the generated images will be written to file.

The example below demonstrates this and writes 9 images to a "images" subdirectory with the prefix "aug" and the file type of PNG.

```python
# Save augmented images to file
from keras.datasets import mnist
from keras.preprocessing.image import Image
from matplotlib import pyplot
import os
from keras import backend as K
K.set_image_dim_ordering('th')
# load data
(X_train, y_train), (X_test, y_test) = mnis
# reshape to be [samples][pixels][width][he
X_train = X_train.reshape(X_train.shape[0]
X_test = X_test.reshape(X_test.shape[0], 1
# convert from int to float
X_train = X_train.astype('float32')
X_test = X_test.astype('float32')
# define data preparation
datagen = ImageDataGenerator()
# fit parameters from data
datagen.fit(X_train)
# configure batch size and retrieve one batch of images
os.makedirs('images')
for X_batch, y_batch in datagen.flow(X_train, y_train, batch_size=9, save_to_dir='images', s
    # create a grid of 3x3 images
    for i in range(0, 9):
        pyplot.subplot(330 + 1 + i)
        pyplot.imshow(X_batch[i].reshape(28, 28), cmap=pyplot.get_cmap('gray'))
    # show the plot
    pyplot.show()
    break
```

Running the example you can see that images are only written when they are generated.

Augmented MNIST

Tips For Augmenting Image D

Image data is unique in that you can review the da[...] [...]y
get an idea of how the model may be perceive it b[...]

Below are some times for getting the most from im[...]
learning.

- **Review Dataset**. Take some time to review your dataset in great detail. Look at the images. Take note of image preparation and augmentations that might benefit the training process of your model, such as the need to handle different shifts, rotations or flips of objects in the scene.
- **Review Augmentations**. Review sample images after the augmentation has been performed. It is one thing to intellectually know what image transforms you are using, it is a very different thing to look at examples. Review images both with individual augmentations you are using as well as the full set of augmentations you plan to use. You may see ways to simplify or further enhance your model training process.
- **Evaluate a Suite of Transforms**. Try more than one image data preparation and augmentation scheme. Often you can be surprised by result[...] [...] would be beneficial.

Summary

In this post you discovered image data preparation and augmentation.

You discovered a range of techniques that you can use easily in Python with Keras for deep learning models. You learned about:

- The ImageDataGenerator API in Keras for generating transformed images just in time.
- Sample-wise and Feature wise pixel standardization.
- The ZCA whitening transform.

- Random rotations, shifts and flips of images.
- How to save transformed images to file for later reuse.

Do you have any questions about image data augmentation or this post? Ask your questions in the comments and I will do my best to answer.

Andy August 2, 2016 at 7:34 am #   REPLY ↩

Interesting tutorial.

I'm working through the step to standardize images across the dataset and run into the following error:

AttributeError Traceback (most recent call last)

in ()

18 datagen.flow(X_train, y_train, batch_size=9)

19 # retrieve one batch of images

—> 20 X_batch, y_batch = datagen.next()

21 # create a grid of 3×3 images

22 for i in range(0, 9):

AttributeError: 'ImageDataGenerator' object has no attribute 'next'

I have checked the Keras documentation and see

Perhaps I'm missing something.

Thanks for the great tutorials!

Jason Brownlee August 2, 2016 at 8:21 a

Yep, the API has changed. See:

https://keras.io/preprocessing/image/

I will update all of the examples ASAP.

UPDATE: I have updated all examples in this p
problems at all.

Jason Brownlee November 29, 2016 at 8[:__]

Great suggestion, thanks Addie.

Lucas December 24, 2016 at 9:02 am #   REPLY ↩

I wonder what `channel_shift_range` is about. The doc says "shift range for each channels", but what does this actually mean? Is it adding a random value to each channel or doing something else?

Jason Brownlee December 26, 2016 at 7[:__]

Your Start in Machine Learning

I have not used this one yet, sorry Lucas.

You could try experimenting with it or dive into the source to see what it's all about.

Indra December 26, 2016 at 5:30 pm #   REPLY ↩

Hi,

Thanks for the post. I've one question i.e., we do feature standardization in the training set, so while testing, we need those standardized values to apply on testing images ?

Jason Brownlee December 27, 2016 at 5:22 am # REPLY ↩

Yes Indra, any transforms like standardization performed on the data prior to modeling will also need to be performed on new data when testing or making predictions.

In the case of standardization, we need to keep track of means and standard deviations.

Dan March 11, 2017 at 11:01 pm # REPLY ↩

Thanks again Jason. Why do we subplot 3

Jason Brownlee March 12, 2017 at 8:24

This is matplotlab syntax.

The 33 creates a grid of 3×3 images. The numb place the next image (left to right, top to botto

I hope that helps.

can we augment data of a particular class. I mean images of a class which are less, to deal with the class imbalance problem.

Jason Brownlee March 22, 2017 at 8:06 am # REPLY ↩

Great idea.

Yes, but you may need to prepare the data for each class separately.

Lebron March 26, 2017 at 4:07 pm #   REPLY ↩

Hi Jason,

Thanks for your post!

I have a question: Does this apply to image data with RGBXYZ for each pixel?

Each of my input image is of six channels including RGB and XYZ (world coordinate), which was acquired from an organized point cloud by PCL(Point Cloud Library). I am wondering whether there is a correct way to do data augmentation for my image

I think ImageDataGenerator might be correct only f~~~~ the RGB image, it means camera movement indee~~~~ well.

Thanks.

Lebron March 27, 2017 at 3:51 pm #   REPLY ↩

Thanks Jason!

To confirm, do you mean image with RGB only by "3d pixel data"? And if I have more channels, I have to do all the augmentation by myself, rather than using Keras API?

Jason Brownlee March 28, 201   REPLY ↩

Your Start in Machine Learning

Yes, I believe that to be the case, but I could be wrong.

Brian April 16, 2017 at 9:35 am #   REPLY ↩

When I use zoom_range of 0.2 and inspect the output images, it seems to zoom h and v axes independently. However I want to have a small amount of zoom variation while preserving the aspect ratio of the images.

Also, when I specify a rotation_range, the rotated images have aliasing artefacts. Is there any way to specify rotations with antialiasing?

Jason Brownlee April 17, 2017 at 5:06 am #   REPLY ↩

I'm not sure off hand.

Do you think these concerns will affect the skill of the model?

Brian April 19, 2017 at 11:15 am #   REPLY ↩

Hi Jason,

Thank you for your post! Very clear!
I am trying to use ImageDataGenerator now. But if I want to apply feature standardization to unseen
data in the future, I need to save the ImageDataGenerator to disk, right? Any suggestion to do it?
Thanks a lot.

Jason Brownlee May 5, 2017 at 7:29 am #

That is correct, or you can standardize manually and just save the coefficients used.

RogerLo May 17, 2017 at 2:23 pm #

Hi Jason

I using Keras 2.x 'tf' seeting.
Why I can't using
X_batch, y_batch = datagen.flow(train, train, batch
For example :

from keras.datasets import mnist
from keras.preprocessing.image import ImageData

load data
(X_train, y_train), (X_test, y_test) = mnist.load_data
# reshape to be [samples][pixels][width][height]
X_train = X_train.reshape(X_train.shape[0], 28, 28,1
X_test = X_test.reshape(X_test.shape[0], 28, 28,1)
# convert from int to float
X_train = X_train.astype('float32')
X_test = X_test.astype('float32')
# define data preparation
datagen = ImageDataGenerator(featurewise_center=True, featurewise_std_normalization=True)
# fit parameters from data
datagen.fit(X_train)
# configure batch size and retrieve one batch of images
X_batch, y_batch = datagen.flow(X_train, y_train, batch_size=9)

Can you tell me why?
Thanks!

correctly evaluate the model or not? Is the same for predict_generator? I'm a little confused.

Your Start in Machine Learning

Matthew Hancock June 25, 2017 at 1:03 am #

Hi Jason,

I have a quick question about the image augmentation. I am attempting to greatly increase the size of my training data set using data augmentation in order to increase my segmentation accuracy. Does the image generator feed multiple augmentations of the same image to the model or does it just return a single augmented version instead of the original? There seems to be no way to modify the number of augmented images the Image Data Generator actually returns.

Matthew Hancock June 25, 2017 at 1:06 am #   REPLY ↰

Never mind, I found my answer in the Keras documentation.

Jason Brownlee June 25, 2017 at 6:03 am #   REPLY ↰

Nathan July 25, 2017 at 6:39 pm #

I think the problem of Alice is the
modification are never the same, which is difficult to make a comparison because they change everytime.

For example :
-the first plot gives me : 5 6 3, 0 1 9, 2 3 1
– after the ZCA whitening i have : 2 3 8, 3 2 5, 0 1 7

Jason Brownlee July 26, 2017 at 7:48 am #

Yes, by design, the augmenta   images each time it is called.

Your Start in Machine Learning

This is what we want, so the model does a better job of generalizing.

What is the problem exactly, could you help me to understand please?

Antoine Simon July 25, 2017 at 10:59 pm #

Hello Jason,

I have the same problem as Alice. I think that what she was saying was that the pictures that she plot after random modifications are never the same

It looks like the 9 pictures that are plotted are chosen randomly everytime.

It would be nice if you could answer me on this problem,

Thank you !

Jason Brownlee July 26, 2017 at 7:54 am #   REPLY ↩

Yes, this is by design. This is exactly what we want from image augmentation.

john Landler July 25, 2017 at 5:45 am #

Hi,

When I run the above script, I get this error:
Using TensorFlow backend.
C:\Users\sacheu\AppData\Local\Programs\Python
packages\keras\preprocessing\image.py:653: User
array) following the data format convention "chann
or 4 channels on axis 1. However, it was passed ar
' (' + str(x.shape[self.channel_axis]) + ' channels).')

can you please tell me how to fix it?
i think i have the latest version of the libraries. And

Thank you.

Jason Brownlee July 25, 2017 at 9:49 am #   REPLY ↩

You could try changing the order of the channels in code or in the Keras configuration file.

For example, in code:

```
1  from keras import backend as K
2  K.set_image_dim_ordering('th')
```

Or if this is the cause, comment it out.

Tom November 11, 2017 at 2:10 am #   REPLY ↩

I have the same problem. Nothing works.

The message is a warning, and I still get the output images, but i.e. Feature Standardization is black and white, not gray scaled. So I suppose it is not working?

When I try to comment it out or change the order from 'th' to 'tf' – it completely brakes. The message is: … (28 channels)

I am new and any comments are welcome.

Jason Brownlee November 11, 2017 at 9:23 am #   REPLY ↰

Perhaps double check you have the latest version of Keras installed? 2.0.8 or 2.0.9?

Your Start in Machine Learning

You can change the backend used by Keras in the ~/.keras/keras.json configuration file.

Tom November 13, 2017 at 9:18 pm #

Ok, at the moment I can say that:

– Those warning messages are just a warning. They are in each example. I do not know how to make them disappear, but it turns out that they are harmless.

– Example Feature Standardization is black and white, not gray scaled. Maybe there is an error in script? I am to novice to spot it.

– Other examples seems to work correctly despite the warning message. (So I just saw a warning, saw different output, spotted comment with similar problem and just stopped. My bad).

– I can write set "KERAS_BACKEND=tensorflow" to change the backend (I don't know what does it means, but never mind 🙂).

– You are awesome for making those tutorials. Thank You!

Jason Brownlee November

Thanks.

Are you able to use the flow_from_directory instead of loading it all into memory?
https://keras.io/preprocessing/image/

Willie Maddox December 3, 2017 at 2:44 am #   REPLY ↩

I have the same exact problem with M
memory. The flow_from_directory() requires your data to be in a specific directory structure.

Your Start in Machine Learning

From the Keras v2.1.2 documentation…

directory: path to the target directory. It should contain one subdirectory per class.

MS-COCO and NUS-WIDE are not structured this way natively.

Also, Xiaojie was talking specifically about the fit() function, which is called before the flow (or flow_from_directory) function.

Muneer Ahmad Dedmari August 20, 2017 at 10:02 pm #

Hi Jason,

Thanks for this nice post. I have a quick question. I have large-dataset which I am loading to model using custom data-generator. I am using it in model.fit_generator(). Now I want to use data-augmentation. So my question is, how/where can I use keras ImageDataGenerator? Thank you very much.

Good question, I think some experimentation would be required.

Perhaps use of numpy's hstack and vstack to create a larger array from the image arrays?

Your Start in Machine Learning

Steven March 23, 2018 at 5:05 am #   REPLY ↰

Yeah, I think need some tweaks or look into Keras' mnist_load() function how what the data format is when writing back. This link has the original data format:

http://yann.lecun.com/exdb/mnist/

Scroll down to the bottom for training and test dataset structures. They used some header information for each image. I think hstack and vstack are the way to go, but need to take care of those headers (think should be easy). I am still not sure what those "xxxx" mean. I think the files are just filled by the 28×28 small image data.

Jason Brownlee March 23, 2018 at 6:14 am #

It might be easier to write your own progressive loading function. A heck of a lot simpler actually.
